

**THE
GREENS**

AUSTRALIAN STEEL

Steel Australia for a Green Future

Australia is the only steel making nation that does nothing to protect its blast furnaces from unfair international competition.

The future of tens of thousands of jobs in the Illawarra is now at risk.

BlueScope is threatening to close NSW's last remaining blast furnace. The loss of economic activity could damage employment opportunities for generations of Illawarra residents.

It's our money, it's our steel

The Greens are working with unions in the Illawarra to force state and federal governments to ensure that the steel in their infrastructure projects is at least 50% Australian.

Governments spend billions of dollars of taxpayers' money on new railways, roads, schools, hospitals and other facilities. In NSW, the Baird government has plans for more than \$80 billion of infrastructure, all paid for by the community.

Across the nation, people recognise the importance of the steel industry to Australia's economic future and want it supported against unfair international competition.

Governments should make sure that public money is spent how the public wants it to be.

Steel and the future

Australia has already lost most of its manufacturing industry. The nation and the region cannot afford to lose any more.

The clean energy future will use a lot of steel. Making it here is better for the environment, employment and the economy.

Governments spend billions of dollars of taxpayers' money on new railways, roads, schools, hospitals and other facilities. In NSW, the Baird government has plans for more than \$80 billion of infrastructure, all paid for by the community.

Across the nation, people recognise the importance of the steel industry to Australia's economic future and want it supported against unfair international competition.

Governments should make sure that public money is spent how the public wants it to be.

Steel and the future

Australia has already lost most of its manufacturing industry. The nation and the region cannot afford to lose any more.

The clean energy future will use a lot of steel. Making it here is better for the environment, employment and the economy.

A strong steel industry in the Illawarra will be a platform for the growth of green jobs in renewable energy technology manufacture, efficient building products and next generation public transport.

If the blast furnace goes, NSW risks missing out on the green future jobs boom.

Steel, coal mines and climate

Steel manufacture is a big emitter of greenhouse gases that are affecting the climate. But it doesn't matter where the steel is made, millions of tonnes of carbon dioxide will be released each year.

BlueScope uses about 3 million tonnes of coal each year, which is a tiny fraction of the total amount mined in NSW. The vast majority of metallurgical coal extracted in NSW is exported to China, Korea and India.

There are exciting new developments in steel making that could cut the use of coal and replace it with hydrogen made from sea water and large arrays of solar panels.

The Greens believe that the Illawarra can be a world leader in low coal steel. Getting ahead of the rest of the world would open up new markets as industrialised nations look to cut their carbon footprints.

Time to take back the steel

The Greens are demanding that state and federal governments lock in the future of steel making using infrastructure procurement policies. We are also campaigning for government to begin to take up ownership of the Port Kembla Steel Mill, so that jobs can be secured and the plant can be transformed to lead the low-coal steel revolution.

- ▲ The Australian Greens have initiated two successful motions in federal Parliament calling on the Coalition government to save the Port Kembla steel industry.
- ▲ The Greens NSW have called for the Baird government to take up part ownership of the steel mill in return for financial support delivered through requiring at least 50 percent of all steel in publicly-funded infrastructure projects to come from Australian blast furnaces.

Please contact Senator Rhiannon's office if you would like to get involved with the campaign:
